Introduction

- There is a two year gap between learning anatomy and applying it clinically.
- Clinicians feel that the current anatomical education of medical students is inadequate.
- Students do not feel confident in their anatomy knowledge and have difficulty transferring it from the classroom to the clinic.
- Previous data from our own institution quantified this knowledge deficit, specifically for the surgery and obstetrics/gynecology (ob/gyn) clinical rotations.
- Suggestions for improvement include vertical integration or nesting, so that relevant topics are revisited from Year I to Year IV.
- Using principles of adult learning and instructional design, a series of interactive e-modules were created to review clinical anatomy in areas students were found to be weakest.
- The goal of this study is to evaluate the impact of this newly designed method of teaching clinically relevant anatomy to medical students on surgical rotations.

Methods

- Two methods of vertical integration were created.
- Institutional Review Board approved protocol:
  - MSIIIs at GWUMC (N=189)
  - 20-25 question exam: 15-10 MCQs and 5-10 image labeling
  - Exam had basic science and clinical input.
  - These questions were compared against those from the relevant anatomy exams during their first year (t-tests with corrections).
  - Based on this knowledge gap, e-modules were created to review relevant clinical anatomy.

Results Phase 1

- Preliminary Results Phase 2

Table: Mean surgical anatomy quiz grades by rotation number prior to start of clerkship

<table>
<thead>
<tr>
<th>Rotation</th>
<th>Pre-Test Mean</th>
<th>Post-Test Mean</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>76.00%</td>
<td>88.00%</td>
</tr>
<tr>

Results Phase 2

- During the first week of the surgery and ob/gyn clerkships, a link to a secure website containing the modules is distributed to students.
